

How it Works

The Vortex Water Revitalizer's double spiral flow form simulates the natural movement of water & creates a powerful vortexing action.

This causes implosion in the water.

Implosion:
Restores the natural structure health, and vitality to the water.

Implosion:
Increases and/or activates dissolved oxygen in the water.

Implosion:
Micro-clusters the water molecules.

Micro-Clustered Water is formed as a result of the implosion process water is put through as it passes through the Vortex Water Revitalizer. The structure of water is made up of clusters of interlinked water molecules. As a result of implosion, these clusters are dispersed into smaller groups of water molecules, called micro-clusters.

Benefits:

- Superior in absorption, leading to better hydration.
- Improves the taste, feel and quality of water.
- Toxins and heavy gases, like chlorine, are released from the hold of the water molecules, causing them to evaporate from the water when released from a tap.

Increased & Activated Dissolved Oxygen in the water is also the result of the implosion process caused by the Vortex Water Revitalizer.

Benefits:

- Activated dissolved oxygen aggressively interacts with pollutants and toxins in the water, eliminating, reducing, or causing them to be less harmful to the body.
- Increased dissolved oxygen creates an inhospitable environment for anaerobic (bad) bacteria, like E.Coli and Coliform.
- Increased dissolved oxygen in the water creates a more hospitable environment for aerobic (good) bacteria, which aid in the delivery of nutrients to plants, the decomposing of wastes and the efficient break down of sewage.

Other Benefits of the Vortex Water Revitalizer:

- Naturally softens water.
- Restores the natural pH balance to water.
- Significantly improves the taste and feel of water.
